

ABSTRACT

INFLUENCE OF HUMAN FETAL LIVER EXTRACT ON HEPATOCYTE NUCLEARITY IN MODEL LIVER CIRRHOSIS

Evaluation of reparative regeneration processes after administration of human fetal liver extract was carried out in animals with experimental liver cirrhosis. The ability of fetal tissues to restore the amount of parenchyma cells was proven, and this was probably accounted to development of multi-nuclear hepatocytes in cirrhotic liver.

Key words: liver cirrhosis, CCl₄, liver extract, fetal tissues, nuclearity
